Stroke And 2 Stroke Petrol Engines

... The maximum amount of power generated by an engine is determined by the maximum amount of air ingested. The amount of power generated by a piston engine is related to its size (cylinder volume), whether it is a two-stroke engine or four-stroke design, volumetric efficiency, losses, air-to-fuel ratio, the calorific value of the fuel, oxygen content of the air and speed ().

Four-stroke engine - Wikipedia A 4-stroke engine has a completely sealed cylinder, the valves only open at the top, into the combustion chamber. So the oil that lubricates the engine is kept away from the combustion chamber. A 2-stroke engine, cannot do this. When the piston passes the intake port, the combustion

like ethanol into gasoline it's much harder to fine-tune the combustion process like you can in a more complex 4 stroke automobile engine. 2 Stroke vs 4 Stroke: Avoid Ethanol In Small Engines More Torque. In general, 4-stroke engines almost always make more torque at low RPM than 2-strokes. This extra torque has a lot to do with the efficiency of the fuel burn; a 4-stroke uses almost all of its fuel to impart power to the crankshaft, whereas fuel crossover in a 2-stroke means that it will produce less power per RPM. 2-strokes do enjoy an advantage in high-RPM power output, but simply don't produce the torque of a 4-stroke.
